# <u>Dashboard</u> / <u>My courses</u> / <u>PSPP/PUP</u> / <u>Experiments based on Lists and its operations.</u> / <u>Week6 Coding</u>

Started on	Tuesday, 30 April 2024, 2:38 PM
State	Finished
Completed on	Sunday, 12 May 2024, 2:32 PM
Time taken	11 days 23 hours
Overdue	9 days 23 hours
Marks	10.00/10.00
Grade	<b>100.00</b> out of 100.00

Question **1**Correct
Mark 1.00 out of 1.00

Consider a program to insert an element / item in the sorted array. Complete the logic by filling up required code in editable section. Consider an array of size 10. The eleventh item is the data is to be inserted.

# Sample Test Cases

## Test Case 1

# Input

## Output

### ITEM to be inserted:2

After insertion array is:

## Test Case 2

# Input

- -

## Output

# ITEM to be inserted:44

After insertion array is:

```
55
66
77
88
99
110
120
Answer: (penalty regime: 0 %)
     arr = [int(input()) for _ in range(10)]
   3 item = int(input())
   4 print(f'ITEM to be inserted:{item}')
   5
   6 index = 0
   7 while index < len(arr) and arr[index] < item:</pre>
   8
        index += 1
     arr.insert(index, item)
   9
  10
  print("After insertion array is:")
  12 v for num in arr:
         print(num)
  13
  14
```

Question 3
Correct
Mark 1.00 out of 1.00
```

Write a program to print all the locations at which a particular element (taken as input) is found in a <u>list</u> and also print the total number of times it occurs in the <u>list</u>. The location starts from 1.

For example, if there are 4 elements in the array:

5

6

5 7

If the element to search is 5 then the output will be:

5 is present at location 1

5 is present at location 3

5 is present 2 times in the array.

Sample Test Cases

Test Case 1

Input

4 5

6

5

7 5

Output

5 is present at location 1.

5 is present at location 3.

5 is present 2 times in the array.

Test Case 2

Input

5

67

80 45

97

100 50

Output

50 is not present in the array.

```
1 def find_element_locations(arr, element):
        locations = [i + 1 \text{ for i, num in enumerate(arr) if num} == element]
2
3
        count = len(locations)
4
        if count > 0:
            print('\n'.join([f"{element} is present at location {loc}." for loc in locations]))
5
            print(f"{element} is present {count} time{'s' if count > 1 else ''} in the array.")
6
7
            print(f"{element} is not present in the array.")
8
9
10
    # Input
   n - int(innut())
```

```
12 | arr = [int(input()) for _ in range(n)]
13 | element_to_find = int(input())
14 | 15 | # Output
16 | find_element_locations(arr, element_to_find)
17
```

	Input	Expected	Got	
~	4	5 is present at location 1.	5 is present at location 1.	~

Question **4** 

Mark 1.00 out of 1.00

Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the right are equal. The array may not be reordered.

## Example

### arr=[1,2,3,4,6]

- the sum of the first three elements, 1+2+3=6. The value of the last element is 6.
- · Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.
- · The index of the pivot is 3.

#### Constraints

- $\cdot \qquad 3 \le n \le 10^5$
- ·  $1 \le arr[i] \le 2 \times 10^4$ , where  $0 \le i < n$
- It is guaranteed that a solution always exists.

The first line contains an integer n, the size of the array arr.

Each of the next n lines contains an integer, arr[i], where  $0 \le i < n$ .

Sample Case 0

Sample Input 0

4

1

2

3

3

# 2

Sample Output 0

Explanation 0

- The sum of the first two elements, 1+2=3. The value of the last element is 3.
- · Using zero based indexing, arr[2]=3 is the pivot between the two subarrays.
- · The index of the pivot is 2.

## Sample Case 1

# Sample Input 1

3

1

2

1

# Sample Output 1

1

#### Explanation 1

- The first and last elements are equal to 1.
- · Using zero based indexing, arr[1]=2 is the pivot between the two subarrays.
- The index of the pivot is 1.

### For example:

Input	Result
4	2
1	
2	
3	
3	
3	1
1	
2	
1	

# **Answer:** (penalty regime: 0 %)

Question 6
Correct
Mark 1.00 out of 1.00
```

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

5

1

2

2

3

4

Output:

1234

Example Input:

Correct

Question 10

Correct

Mark 1.00 out of 1.00

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the  $p^{th}$  element of the <u>list</u>, sorted ascending. If there is no  $p^{th}$  element, return 0.

## **Example**

n = 20

p = 3

The factors of 20 in ascending order are  $\{1, 2, 4, 5, 10, 20\}$ . Using 1-based indexing, if p = 3, then 4 is returned. If p > 6, 0 would be returned.

### Constraints

 $1 \le n \le 10^{15}$ 

 $1 \le p \le 10^9$ 

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

### Sample Case 0

## Sample Input 0

10

3

### Sample Output 0

5

### **Explanation 0**

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . Return the  $p = 3^{rd}$  factor, 5, as the answer.

## Sample Case 1

### Sample Input 1

10

5

## Sample Output 1

0

## **Explanation 1**

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . There are only 4 factors and p = 5, therefore 0 is returned as the answer.

# Sample Case 2

# Sample Input 2

1

1

## Sample Output 2

1

### **Explanation 2**

Factoring n = 1 results in {1}. The p = 1st factor of 1 is returned as the answer.

## For example:

Input	Result		
10	5		
10 5	0		

```
Input Result

1 1
1
```

## Answer: (penalty regime: 0 %)

```
1 import math
 3 

def factor(n):
        factors = []
for i in range(1, int(math.sqrt(n)) + 1):
 4
 5 1
            if n % i == 0:
 6 🔻
 7
                 factors.append(i)
 8
                 if i != n // i:
                     factors.append(n // i)
9
10
        return sorted(factors)
11
12
    def get_pth_factor(n, p):
        factors = factor(n)
13
14
        return factors[p - 1] if p <= len(factors) else 0</pre>
15
16
   n = int(input())
17
18
   p = int(input())
19
   # Output
20
21 print(get_pth_factor(n, p))
```

	Input	Expected	Got	
~	10	5	5	<b>~</b>
~	10 5	0	0	~
~	1	1	1	<b>~</b>

Passed all tests! ✓

### Correct

Marks for this submission: 1.00/1.00.
